NEWPACFINISHING
Chicago, Ill.

January 15th 1995

Dear Sir,

We bought a Composite Titanium washer NEWPAC 1700 in 1988, and I have to say that we have been happy with it since. We plan to transfer our painting and finishing operations, which means we should be reselling our equipments, including the Newpac washer. However, we would like to recommend it to prospective customers.

First, Newpac washer is far superior to a Stainless Steel washer as it really lowers maintenance : clean up is easy, high pressure wash and it looks like new. In fact its physical appearance looks very good.

Clean out doors in the tanks made sludge removal easy.

Having decided to go for an innovative machine, we found that it did more for us than any other washer could ever do:

- It has dramatically reduced the time and money spent on maintenance. We wanted a reliable and simple machine, with a design our operators would find easy to understand.
- It has reduced our energy costs (this is the major advantage of NEWPAC washers)

I have learned that it was our Lennox USA colleagues who insisted on having tanks made of composites for their NEWPAC, when these were still at the prototype stage and only the top of the NEWPAC tunnels were in composite.

Like our colleagues we decided that we should not be deprived of such a profitable innovation.

Best Regards,

Chun PANG
Sr. Eng. Operations
